

Summary

CIS220 Enterprise Architecture

This class was an introduction to enterprise architectures that allowed us to examine a number of subjects, such as system component relationships, managing application integration, and emerging technologies, from several different perspectives. Our studies included an examination of the Enterprise Application perspective, the Data perspective, the Network perspective, and the Technology perspective.

A majority of this class involved research on different subjects within these different perspectives, such as Six Sigma, Business Process Management, Hosted and Cloud Computing Services, Operational Data Stores, and Data Warehousing. This research built upon knowledge that I had learned in other classes, and allowed me to understand how the different perspectives can be used to determine requirements for an enterprise system architecture based upon those perspective's needs.

I have included the Powerpoint documents that our team used for our classroom presentations.
