

## **Summary**

### **CIS234 Systems Design & Development**

Systems Design & Development took the solution recommended in the CIS233 Systems Analysis class as a foundation to design and implement a prototype of the proposed system.

Using the CIS233 documentation as a starting point, our team prepared a number of formal reports as part of our design phase. These included a project plan, navigation storyboard, system design document, implementation plan, user manual, and test plan. Using these documents, we created a prototype of the system using a Powerpoint to offer a simple representation of what the working system would conceivably look like as a working system.

I have included several of these documents on the CIS234 panel under the Database IT ATA degree.
