

Summary

CIS235 Requirements Modeling

The Requirements Modeling course provided the opportunity to explore and use a variety of different modeling tools and methods that are currently employed by systems analysts. We used these tools to create a number of different models, including context models, use cases, UML activity diagrams, event response diagrams, conceptual data models, ERDs, and state transition diagrams, to analyze, define, and document the business information system requirements for two separate case studies.

The final reports and presentations for each case study are included on the CIS235 panel.
