

Summary

CIS241 Web Development I - XHTML

Web Development 1 was the first programming class that I have taken after my Intro to Programming class 3 or 4 years prior. This class was an introduction to internet and intranet Web site development using XHTML/HTML (and a tiny bit of CSS and XML).

In this class, I learned how to document, develop, debug, and maintain a simple website. In my various projects I learned how to use tags, forms, linked objects, frames, and tables, as well as how to use inline and embedded Cascading Style Sheets. I also learned how to create a standardized site design to use as a page template.

The majority (if not all) of my projects throughout the quarter were incorporated into my final project, which is a multi-page website using just about everything that I learned in this class. For that reason, it is the only project that I included from this class in my portfolio.
