

Summary

CIS254 Database Procedures & Functions

This course is an addition to the CIS251 Intro to SQL course and served to expose me to the data manipulation language (DML) use in creating functions and procedures. The various projects within the coursework taught me how to create stored functions, call functions, save points and roll backs, as well as how to define exception handlers and loops using DML.

I seem to have lost the majority of the coursework that I did for this class, thus the only example I have is an assignment to create a procedure.
