

## **Summary**

### **CIS298 Advanced Individual Project**

While this class is usually intended to assign a project for an individual student to display their proficiency with techniques, technologies, and tools learned in the course of their education, I was actually one of three individuals hand-picked by the teacher for this class to assist in doing a needs analysis and System Requirements Document for the Student Learning Center on the Edmonds Community College campus.

This class gave me the opportunity to work with a teacher that I feel has a great deal of Database IT related knowledge and two students whose work ethics and commitment to quality are comparable to or exceed my own, so I was very comfortable working with all of them and this class was a very enjoyable team experience. It gave all of us the opportunity to display what we had learned in prior classes like Systems Analysis, Enterprise Architecture, Requirements Modeling, and Database Theory and Design, while we analyzed the issue presented to us, documented the existing system, researched alternatives, and provided a recommended course of action for the college IT department to implement.

The final document and Powerpoint that we presented to the IT department are included in the CIS298 panel.
